GEORGIA AGRICULTURAL FACTS

1982 EDITION

Georgia Crop Reporting Service

BEST AVAILABLE COPY

October, 1982

MESSAGE FROM THE COMMISSIONER

Fellow Georgians:

Although most people do not realize it, Georgia's agricultural picture is continually changing.

The planted acreage of some crops does not change too drastically from year to year but we are experiencing major shifts in the production of others as farmers try to produce for the best market opportunities.

The tremendous growth in wheat and soybean acreages in Georgia are two examples. The 1982 decrease in corn acreage and the gradual increase in vegetable production are two other examples.

For farmers, as well as the agribusiness community to plan properly, they must have a good understanding of what is happening over the state as a whole and this is where the role of agricultural statistics plays so important a part.

The information contained in this book of agricultural facts is designed to help guide all those interested in agricultural production and, as an annual publication, has proved its worth through the years.

Published by the Georgia Department of Agriculture under a cooperative agreement with the Georgia Crop Reporting Service, Statistical Reporting Service, U.S. Department of Agriculture, this publication is dedicated to the continued growth and expansion of Georgia's agricultural resources.

Sincerely,

Tommy Irvin

FOREWORD

It's with pleasure that the Georgia Crop Reporting Service presents this 1982 edition of Georgia Agricultural Facts. Published by the Georgia Department of Agriculture under a cooperative agreement with USDA's Statistical Reporting Service, it provides Georgia agriculture with a current data base that has been maintained by the Georgia Crop Reporting Service since the early 1900's. Included in this edition are all significant state and county agricultural statistics generated by this office for the 1981 crop year.

The 1981-1982 period continued the unpleasant plight of many agricultural producers. Although yields improved substantially from the drought stricken 1980, high production costs and low prices received resulted in another dismal financial year for many Georgia livestock, poultry and crop producers.

Some major changes occurred in the Federal estimating program of the Georgia Crop Reporting Service in the spring of 1982. Selected crop, livestock and economic data series were eliminated or modified due to reduced Federal appropriations. In addition, a new system of user fees for releases was implemented at mid-year. The primary purpose of the USDA wide user fee system is to recover postage and reproduction costs associated with the distribution of releases. Survey reporters and other close cooperators will continue receiving releases free, but most other data users will be required to pay a subscription fee. These charges are necessary to achieve maximum economy in operation of this service. It will also allow us to continue to provide vital agricultural information that is timely and statistically sound to Georgia's farming community.

We are indebted to thousands of voluntary reporters from the Georgia farming and agribusiness community. Each reporter unselfishly gives his time and effort to report various information that relates to his farm and business activities. Without this voluntary cooperation it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assist in this effort.

Sincerely,

Larry E. Snipes
Statistician In Charge

CROPS

Highlights

Those farmers who believe that trouble comes in bunches had those beliefs strengthened in 1981. After severe moisture shortages in 1980, the weather in 1981 was again unfavorable, although not nearly as bad as 1980. The cumulative effect kept water tables low and yields for most crops, except small grains, were unfavorable especially in light of the continued rise in production costs. With profits limited or non-existent, the economic situation on many farms worsened, and for some it was their last year of farming.

Corn Crop Variable

The 1981 corn crop was extremely variable. Most early planted dryland corn and irrigated corn made good yields. Much of the later dryland plantings received inadequate moisture during the critical ear development stage and yields suffered badly. Some farmers with irrigation systems ran short of water from surface sources and others were not able to supply adequate moisture at the critical stage of crop development due to the severe dry conditions and the limitations of irrigation systems.

The statewide average yield of 50 bushels per acre was better than 1980, but individual farm yields tended to be at the extremes, either very good or very bad. Those who irrigated and made very respectable yields saw profits shrink drastically as costs climbed and the season average price of corn dropped 20 percent from the 1980 crop to only $2.75 per bushel. The low price was a result of large supplies from a record high U.S. production. Georgia's production totaled 69 million bushels, up 26 percent from 1980 but still 32 percent below the good crop of 1979.

Soybean Plantings Down but Harvested Acres Up

Soybean plantings in 1981, at 2.30 million acres, dipped 6 percent below the record high plantings of the drought-ravaged 1980 crop. More of the acreage planted was harvestable in 1981 and a record high acreage was harvested. Even with the 2 percent increase in acres harvested, at 2.18 million, overall production was well below the record crop of 1979 due to a mediocre yield of only 19 bushels per acre. The lack of adequate moisture was again the culprit, but yield was still better than for the 1980 crop. To add to the soybean growers' woes, the season average bean price dropped 16 percent to average $6.40 per bushel.

Tobacco Sets Two Records

Georgia's 1981 tobacco crop was a good one. Quality was said to have been the best in many years. Buyers apparently agreed. The $162.50 per hundredweight they paid for the 1981 crop was the highest average price that had ever been paid for the State's tobacco. At 2,200 pounds per acre, the 1981 yield was the highest in six years. Total production, at 121 million pounds was well below the record but the increased price pushed the total value of the crop to $196.6 million, the most valuable in the State's history.

Peanuts Rebound

Peanuts, the State's leading source of crop income, appeared to be in trouble early in the growing season as moisture shortages and extremely high soil surface temperatures threatened the crop. Prospects sharply improved later as showers in late July and early August saved the crop. The 1981 yield, at 2,930 pounds per acre, was nearly a thousand pounds per acre better than the previous year's dry weather damaged crop. Acres harvested, at 565,000, were the largest in over 20 years. Total peanut production for the State was over 1.65 billion pounds. The average price that growers received, at a record 26.8 cents per pound, was nearly 14 percent over the 1980 price. This lifted the value of the crop to nearly $444 million, the highest ever, and the first time it surpassed the $400 million mark.

Cotton Acres and Yield Up, Prices Dip

The acres of cotton harvested in Georgia in 1981 were 9 percent higher than the 1980 crop. At 175,000 acres, it was the largest acreage harvested since 1976. Yield per acre averaged 436 pounds and was 178 pounds per acre above the drought-ravaged 1980 crop. The resulting production for 1981 was 159,000 bales, up 85 percent from the previous year and also the largest crop since 1976. Price received for the 1981 crop dropped 22.2 cents per pound below the previous year's price and averaged only 55.7 cents per pound. Even with the sharp price reduction, the overall value of the lint crop was $42.5 million, up 32 percent.

Wheat Sets Five Records

The record book on Georgia wheat begins way back in 1866. The remarkable 1981 wheat crop almost rewrote the entire book with five new records being established. The five included most acres ever planted to wheat in the State; most wheat acres ever harvested for grain; highest yield ever obtained; largest production and the most valuable wheat crop ever. The only record not broken was the average price received, which occurred in 1979.

Acres planted to wheat, at 1.15 million acres, was up 74 percent above the 1980 seedings and was more than 5 times the 1979 level. Acres harvested for grain, at 1.07 million, was up a comparable amount. As incredible as those two are, yield was the big surprise. When the early spring weather turned so dry, there were dire predictions that the wheat crop was being severely damaged, but it fooled everybody. The dry weather at that particular time, kept yield-robbing fungus diseases at a very low level. When the crop matured and combines started traversing the fields, farmers were very pleasantly surprised. Total production was just over 46 million bushels, more than double the previous year's record production. Despite a 10 percent drop in the average price received for the wheat, the total value of the crop amounted to $151.8 million, also more than double the previous record.

1/ Reported for sample fields used for obtaining Objective Yield data. 2/ Private variety. Includes all numerical variety designations marketed under company name. 3/ Includes varieties with additional numerical designations such as Williams "79", Amsoy "71", Pickett "71", etc. 4/ Tied for first place. 5/ Tied for third place.

Bragg retains title as the most popular soybean variety.

FRUITS, NUTS AND VEGETABLES

Highlights

Despite the erratic weather during the 1981 season, Georgia's fruit, nut and vegetable producers succeeded in increasing the production of most crops. Unfortunately, the price received in the marketplace was much lower than 1980. As a result of the low prices, some production was left unharvested.

Pecan Production Increases, Prices Tumble

Utilized production of pecans totaled 120 million pounds, a 14 percent increase from the 105 million pounds produced in 1980 and the third largest crop of record. More groves continue to be brought under irrigation and other intensive management practices. Many of the groves not receiving the improved management practices had reduced quality in 1981. Quality problems due primarily to moisture shortages at critical stages were reflected in the overall average price received for the crop. The average price dropped to 55.8 cents per pound, which was 22.6 cents below the 1980 price and the lowest average price received since the 1975 crop. The total value of utilized production of the 1981 crop fell to just under $67 million, which was 19 percent below the value of the smaller 1980 crop.

Peach Production Up, Price Slips

Peach production in 1981 increased by 17 percent over the previous year to total 140 million pounds, but weak prices toward the end of the season caused some peaches to be left unharvested. Of the 140 million pounds produced, only 125 million were utilized, which was still a 4 percent increase over the 1980 utilized production. The average price during the 1981 season was 11.8 cents per pound, which was 2.3 cents or 16 percent below the average price for the previous year. The overall total value of utilized production of the 1981 crop declined to $14.75 million, more than $2 million below the 1980 crop value.

Apples Jump 25 Percent

Apple production increased 25 percent to total 45 million pounds, the biggest crop since apple estimates were reinstated in 1976. Due to weak prices, only 40 million pounds of that production was utilized, with the production from some orchards being sold only for juice production. The price for fresh market and processed apples averaged 9.3 cents per pound, off 24 percent from the average price received in 1980. This pulled the overall value of utilized production of the 1981 apple crop down 16 percent from 1980 to total $3,729,000.

Vegetable Prices Dip

Production rose and prices fell for each of the five fresh market vegetables in Georgia's vegetable estimating program. The five include snapbeans, cabbage, tomatoes, watermelons and cantaloups. Snapbean production totaled 21 million pounds, a 6 percent increase. Production was harvested from 7,000 acres for an average yield of 3,000 pounds. The price per hundredweight fell 7 percent to average $25.20. Acres of cabbage harvested in 1981 rose 300 acres to total 3,000 acres. Those acres produced 39.9 million pounds, up 21 percent. The average price nose dived from $10.00 per hundredweight in 1980 to only $6.09 in 1981. This cut the overall value of the cabbage crop to $2,430,000, a 26 percent reduction. Tomato production amounted to 18.6 million pounds, up 15 percent from 1980 despite a reduction in acreage. An exceptionally good yield of 9,800 pounds per acre was obtained. The price received for the crop dropped 30 percent, or $7.80 per hundredweight, to average only $18.00. Value of the crop, at $3,348,000, fell 20 percent from the 1980 value.

Watermelon and cantaloupe acreage was also lower, at 26,400 and 3,500 acres, respectively. Average yields of 11,000 pounds per acre for watermelons and 5,500 pounds per acre for cantaloups were obtained. This boosted production to a little over 290 million pounds for watermelons and 19.3 million for cantaloups. The average price for watermelons dropped 39 percent, to $3.68 per hundredweight, while cantaloup prices fell 30 percent to $6.41 per hundredweight. Collectively, the two melon crops were worth over $11.9 million.

POULTRY AND HONEY

Highlights

The production of commercial broilers, hatching eggs, and turkeys in Georgia, hit a record high during 1981. However, production for all eggs and other chickens fell below 1980 levels. The decrease in egg production was due to the drop in number of layers as the number of eggs per layer increased to a record level. The number of colonies of bees decreased from 1980, but the average yield per colony was well above the previous year. Prices received for broilers, spent fowl from hatchery flocks, and turkeys were all below the previous year, but prices received for spent fowl from other flocks, honey, beeswax and all eggs were above 1980 prices.

The gross income from all chickens and eggs including broilers amounted to $1,020.6 million for the 1981 production year, up $90.9 million from 1980. Georgia still ranks first in the Nation in gross income from all chickens and eggs including broilers but excluding turkeys. The State ranks only below Californis in earnings from eggs and second to Arkansas in earnings from broilers. Gross income from broilers produced in Georgia during 1981 totaled $635.3 million, up 8 percent from the $588.8 million in 1980. Gross income from Georgia produced eggs during the production year of 1981 amounted to $345.4 million, up 14 percent from the 1980 receipts.

Broiler Production Sets Record

Georgia broiler producers sold 614.7 million broilers during 1981 for a total weight of 2.4 billion pounds. This was a 7 percent increase over the 573.9 million broilers produced in 1980 and a 10 percent increase over the 2.2 billion pounds produced in 1980.

The number of spent fowl sold from Georgia's laying flocks in 1981, totaled 22.3 million. Of these, 9.3 million were from hatching flocks and 13 million were from table eggs flocks. A total of 637 million spent hens and broilers were sold for slaughter in 1981, up 7 percent from 1980.

The average price received per pound for broilers in 1981, was 26.5 cents, .5 cents less than 1980.

Egg Production Down

There were 5.6 billion eggs produced in Georgia during 1981, down 1 percent from 1980 and 8 percent from 1979. During 1981, the average number of layers in Georgia was 22.8 million or 2 percent less than the 23.2 million in 1980 and 9 percent less than the 25.1 million in 1979. The average number of layers in hatching egg flocks during 1981 was 5.3 million, slightly more than 1980 and 8 percent more than 1979. The average number of layers in other flocks was 17.4 million, down 2 percent from 1980 and 13 percent from 1979. Georgia's layers produced an average of 245 eggs in 1981 compared with 243 in 1980, 242 in 1979 and 238 in 1978. Hatching egg producers sold 1.2 billion eggs during 1981 of which 72 million were sold as table eggs and 1.1 billion for hatching. Producers of table eggs sold 4.4 billion eggs during 1981 for a total of 5.6 billion eggs sold.

Sale of commercial eggs was 64 percent of the total cash receipts from eggs in 1981 while hatching eggs made up the other 36 percent. The average price per dozen for all eggs during 1981 was 74.3 cents. This was 9.6 cents more than the 1980 average price.

Turkey Production Sets Record

Georgia turkey producers raised 2.7 million turkeys during 1981, the largest of record. This is 15 percent more than the 2.4 million raised in 1980 and 9 percent more than the 2.5 million raised during the previous record year of 1979. Total production in 1981 was 65.3 million pounds, up 20 percent from the 54.5 million pounds produced in 1980 and 6 percent more than the 61.9 million pounds produced in 1979.

Georgia turkey growers received $25.5 million for their turkeys in 1981, up 11 percent from 1980 and 3 percent more than 1979. The average price received for turkeys in 1981 was 39 cents per pound compared to 42 cents in 1980 and 40 cents in 1979.

Honey Production Up

Honey produced in Georgia during 1981 amounted to 5.4 million pounds, 28 percent more than the 4.2 million pounds produced in 1980. The number of colonies in 1981 totaled 145,000, 10 percent less than the 161,000 colonies on hand in 1980. The yield per colony was 37 pounds in 1981, up 42 percent from the 26 pounds in 1980. Yield per colony is low in Georgia because it represents an average of all colonies in the State. Some of the bees in Georgia are kept primarily for poliination of crops or reproducing package bees and queen bees for commercial sale.

The value of honey and beeswax for 1981 was $3.4 million, 38 percent more than the 1980 value. Honey accounted for 96 percent of the total value and beeswax the other 4 percent. The average price per pound of beeswax in 1981 was $1.90, four cents more than in 1980. The estimated value of bee sales in 1981 was $4.4 million. Queen bee sales accounted for approximately 21 percent, package bee sales 79 percent.

LIVESTOCK AND DAIRY

Highlights

Dry and hot weather during the summer of 1981 again plagued Georgia livestock producers. The biggest negative factor for livestock farmers, however, was the continuation of prices at or below the break even level for much of the year. During 1981, hog and pig numbers declined sharply in Georgia as a response to the extended period of poor returns. The number of cattle and calves rose somewhat but prices were only slightly more favorable than for hogs.

Georgia ranked 21st nationally in the number of cattle and calves and 11th in hogs and pigs at the end of 1981. In milk production, the State placed 25th. The number of swine farms in Georgia at 18,000 was down 5,000 from the previous year but the number of cattle operations at 40,000 was up 1,000. The number of farms with milk cows declined from 3,300 in 1980 to 3,100 in 1981. Cash receipts for dairymen and livestock producers totaled $705.5 million, up 24 percent from 1980.

Cattle

All cattle and calves in Georgia as of January 1, 1982 totaled 1.95 million head, a 4 percent increase from the 1.87 million a year earlier. The upward trend of the cattle cycle continued for the third year but at a slower pace. Cash receipts from the sale of cattle and calves in 1981, at $212.1 million, were the fourth highest of record, exceeded only by the $225.6 million in 1973, $258.9 million in 1978 and $309.3 million in 1979. Lower annual average price was offset by more marketings during 1981 resulting in the cash receipt increase. The January 1, 1982 inventory value of all cattle and calves on Georgia farms was set at $643.5 million, a drop of 8 percent from the January 1, 1981 value. The decrease was due to a $45 lower value per head.

The 1981 calf crop totaled 810,000 head, unchanged from the number born in 1980. Colquitt was the leading county in number of cattle and calves on farms.

Hogs

There were 1,520,000 hogs and pigs on Georgia farms on December 1, 1981, down 34 percent from the previous year. Breeding inventory decreased 46 percent to 204,000 head. Hog cash receipts at $289.5 million for 1981 were up 29 percent from the $224.7 million for 1980. The average value of hogs and pigs on hand December 1, 1981 was $63.50 per head, down $3 from the preceding year. The total value of Georgia's hog inventory on December 1, 1981 was $96.5 million compared to $153.0 million for a year earlier.

Georgia pork producers had 345,000 sows to farrow from December 1, 1980 through November 30, 1981, down from the 444,000 sows farrowing during the same period of a year earlier. The average number of pigs saved per litter was 7.19, resulting in a pig crop of 2.5 million, down 20 percent from the previous year's pig crop. Colquitt County led all other counties in the number of hogs and pigs on farms as of December 1, 1981.

Milk Production

Georgia's dairies produced an estimated 1.396 billion pounds of milk during 1981, up 2 percent from the previous year. There was an average of 130,000 milk cows on Georgia's farms during 1981, unchanged from 1980.

The annual average milk per cow was 10,738 pounds, 2 percent above the 10,515 pounds averaged in 1980. Cash receipts from marketings, at $203.8 million were up 7 percent from 1980. Putnam County led all counties in number of cows kept for milk.

Red Meat Production

Slaughter plants in Georgia produced 443.6 million pounds of red meat (beef, veal, pork, mutton) during 1981. This was 3 percent less than the previous year.

Production of beef was up 7 percent, but pork production declined 7 percent from the 1980 level.

FARM INCOME, PRICES AND EXPENSES

Highlights

Gross farm income for Georgia farmers in 1981 at $3.62 billion, increased 20 percent from 1980 while production expenses rose 14 percent to $3.31 billion. As a result, net farm income, after adjustments for changes in inventory values, climbed to $385.3 million in 1981 compared to the record low $74.5 million in 1980 and $663.2 million in 1979 which was the second highest of record. Net income per farm averaged $6,422 in 1981, up from the record low of $1,263 in 1980, but 43 percent below the $11,241 average in 1979. Total farm assets dropped 5 percent while total farm debt jumped 8 percent.

Cash Receipts

Total cash receipts from farm marketings and government payments received by Georgia farmers in 1981 totaled $3.32 billion, 21 percent more than 1980 and 12 percent more than 1979. Cash receipts from the sale of livestock, poultry and their products amounted to $1.74 billion, or 52.5 percent of the total, up 15 percent from 1980 and 8 percent more than 1979. Commercial broilers continued as the leading source of cash farm receipts with $635.3 million, 19.2 percent of the total. Eggs made up 10.4 percent to rank third and hogs ranked fourth with 8.7 percent of the total cash receipts.

Cash receipts from the sale of crops accounted for 46.4 percent of the total and at $1.54 billion, were 29 percent more than the drought plagued crops of 1980. Peanuts were again the leading cash crop with receipts totaling $433.6 million in 1981, almost double the $228.6 million received in 1980. Peanuts accounted for 13.1 percent of the total and ranked second to commercial broilers. Government payments made up the remaining 1.1 percent and at $38.1 million were 32 percent more than 1980.

1981 Farm Production Expenses

Of the $3.31 billion in total farm production expenses in 1981, feed accounted for 21 percent, or $686.1 million, an increase of 4 percent from a year earlier. The largest increase for 1981 was in miscellaneous items, which were up 29 percent to $666.2 million, one-fifth of the 1981 farm production expenditures. Miscellaneous items include, but are not limited to, Federal crop insurance, dairy supplies, electricity, irrigation, pesticides, veterinary services and medicines and interest on production loans. Depreciation and other consumption of farm capital at $457.9 million represented 14 percent of the total and was up 19 percent from a year earlier. Repairs and operation of capital items were $358.7 million which accounted for 11 percent of the total, a 10 percent increase from the previous year. Fertilizer and lime expenses totaled $297.7 million, up 2 percent from 1981, and made up 9 percent of the total. Interest on farm mortgage debt totaled $213.4 million or 6 percent of the total expenses with an increase of 16 percent from last year.

The final 19 percent of 1981 farm expenditures was: Livestock at $144.0 million, up 11 percent; seed at $92.2 million, up 18 percent; taxes on farm property at $77.5 million, up 5 percent and net rent to non-operator landlords, at $63.3 million, up 27 percent from last year.

Balance Sheet for 1982

The Georgia balance sheet for 1982 shows total farm assets at $17.7 billion, down 5 percent from 1981. Claims against assets totaled $4.7 billion in 1982, up 8 percent from 1981. This resulted in equity for 1982 dropping to $13.0 billion, down 9 percent from 1981 and 8 percent below 1980.

The asset values for real estate, livestock and poultry were below both 1981 and 1980 and responsible for the drop in total farm assets. Partially offsetting the drop in assets were increases in machinery, crops, household equipment and financial assets. However, crops and financial assets were still below 1979 and 1980. On the claims side, real estate debt, nonreal estate debt and CCC loans for 1982 were above 1981. Real estate debt and nonreal estate debt were both up 8 percent from 1981, while CCC loans increased 13 percent over the previous year. The debt to asset ratio soared to a record high 26.5 in 1982 compared to 23.4 last year.

Prices Received by Georgia Farmers

Marketing year average prices in 1981 for most livestock, poultry and their products increased over 1980. Broilers, turkeys, beef cattle and calves were the only commodities showing lower average prices from 1980. Broiler prices at 26.5 cents per pound averaged slightly below 1980, as prices fell the last half of the year. With the exception of April, prices for beef cattle in 1981 were consistently below the previous year. Beef cattle averaged $46.80, 10 percent less than 1980. Prices farmers received for calves averaged $56.00 per hundredweight in 1981, a significant drop from the $67.40 the year before. Egg prices averaged 74.3 cents per dozen, 15 percent more than a year earlier. Hog prices in 1981 rose to a peak of $49.80 in August and steadily declined thereafter, to average $43.10 for the year but still registered an increase of 19 percent over the previous year. Turkey prices, at 39 cents per pound, averaged 7 percent below 1980, as prices dropped drastically the last 3 months of the year. Milk prices advanced 5 percent from 1980, to $14.70 per cwt., while milk cow prices were unchanged.

Prices received by farmers for field crops in 1981 were generally below 1980. The season average price for corn was $2.85, compared to $3.45 for the 1980 crop. Cotton prices declined 28 percent from 1980 to 55.7 cents and soybeans dropped from $7.58 in 1980 to $6.05 for 1981. Monthly estimates of wheat prices began in May 1981 and averaged $3.30 per bushel for the year, 10 percent less than 1980. Grain sorghum prices dropped 28 percent from the record high price of $5.32 in 1980 to $3.85 per cwt. in 1981. On the positive side, peanut prices, at 26.8 cents per pound, were 14 percent higher than 1980 and tobacco prices increased 16 percent to $162.50 per cwt. Season average price for rye rose 47 percent to $3.20 per bushel, while oats were 11 percent higher at $1.85 per bushel. Hay prices averaged $66.00 per ton, an increase of 2 percent from 1980. Prices received for most vegetable crops were down compared with 1980. Melons, tomatoes, cabbage and snapbeans all showed decreases, but sweetpotato prices rose slightly. Season average prices for apples, peaches and pecans were all below 1980 levels.

Prices Paid by Georgia Farmers

Average prices paid by farmers for commodities and services rose substantially in 1981. The greatest increases were in pesticide prices which averaged nearly 12 percent more than 1980. Fertilizer prices were up about 10 percent compared to a year earlier, with increases ranging from 7 percent for 4-8-12 to 21 percent for ammonium nitrate. Super-phosphate declined 4 percent from 1980 to $228 per ton. Motor supplies, services and fuels also averaged about 10 percent more than the previous year. Farm machinery prices increased nearly 9 percent from 1980, as 110-129 horse power tractors were up 17 percent and large combines up 14 percent. Feed prices averaged more than 8 percent above 1980 with turkey grower showing the largest increase, 18 percent more than the previous year. Farm supplies averaged about 6 percent above the previous year, while building materials were up about 4 percent.

GENERAL

Weather and Crop Summary, 1981

The year began in Georgia with a very cold and dry January. There was a serious shortage of surface water in the State, with many reporting dry wells, especially in south Georgia. Overall, spring was very favorable for planting with adequate soil moisture in most areas. Light freeze damage caused some concern to low lying peach orchards in March, but losses were at a minimum. Late spring was accompanied by a warm dry spell which placed many crops under stress. There were reports of some loss of small grain acreage in the southwest during April but wheat yields soared to a record high 43.0 bushels per acre and generally surprised everyone. Yields for oats and rye were also at record levels. June and July continued the hot dry spell with temperatures soaring to the 100 plus degree range in many areas of south Georgia. August was the first month since February with above normal rainfall. This brought some relief to late crops and pastures but was too late for many of the earlier maturing crops.

September saw many additional dry creeks, ponds and wells in the State. The fall harvest season (September, October and November) was slightly cooler than normal with below normal rainfall. Although not as bad as the previous year, 1981 continued the trend of too little rainfall and too much heat during most critical crop development periods. Georgia's average cumulative rainfall in 1981 was 42.35 inches, which was 8.33 inches below normal. Average temperature for the State was 62.3 degrees, 1.3 degrees below normal.

January

For the month of January, temperatures averaged 5 to 6 degrees below normal in the north and 6 to 8 degrees below normal in the south. Precipitation was light throughout the State. Some snow fell in the mountains on the 7th. For many areas in north Georgia, it was the driest January on record. Surface water was very low throughout the State and many domestic wells were dry, especially in south Georgia. Average temperature for Georgia in January was 40.5 degrees, 6.3 degrees below normal while rainfall averaged 1.12 inches, a little more than 3.0 inches below normal. Soil moisture was short to very short over most of the State by the end of the month. Crops and livestock were in fair to good condition, though weakened by the cold weather. By the end of January, winter grazing was becoming short in many areas.

February

Early February saw a continuation of cold dry weather in Georgia. Weekly average temperatures early in the month were as much as 17 degrees below normal and contributed to less than favorable conditions for livestock. Middle to late February saw more favorable conditions with warmer temperatures and increased rainfall, especially in the north. Small grain conditions improved significantly during the month. February rainfall averaged well above normal at 5.88 inches but temperatures were slightly below normal at 48.2 degrees. By the end of the month, soil moisture supplies were adequate.

March

Warmer weather and statewide rainfall occurred in early March. Drier and cooler conditions set in after the 6th and continued through the 29th. There was some scattered frost damage to peaches in mid-March but losses were at a minimum. Growing conditions for both small grains and row crops continued to worsen as the month progressed, due to cool and dry weather. Beneficial rain over much of the State, and very heavy rainfall in the west central region on the 30th and 31st materially improved soil moisture supplies. Average statewide temperature for March was 52.7 degrees, while rainfall was 4.11 inches, both well below normal. Planting of early crops was well underway by month's end.

April

Temperatures warmed to well above normal the first week of April, averaging from the mid-50's in the mountains to the upper 60's in the south. Almost all small grain was headed by mid-April. By late April planting of corn, tobacco and watermelons was nearing completion with progress ahead of last year. The lack of rain in late April caused stress on row crops and some abandonment of small grain in southwest Georgia. Soil moisture supplies by the end of the month were very short to mostly short over most of the State. Georgia's average temperature for April was 66.8 degrees, 2.7 degrees above normal, while rainfall at 2.68 inches, averaged 1.52 inches below normal.

May

May began with soil moisture supplies rated as very short to mostly short throughout the State. Some limited relief came early in the month by way of cooler temperatures and some much needed rainfall. Most crops were rated in fair to good condition by mid-May and sweet onion harvest was active in the east central region. Showers and thundershowers at the end of the month brought some relief from dry conditions to many northern areas. However, an area from southwestern to east central Georgia was very short of soil moisture and grazing conditions had deteriorated to such an extent that many cattlemen were being forced to feed hay to livestock. May temperatures averaged 67.9 degrees, 3.5 degrees below normal for the month, while rainfall was .91 inch less than normal, at 2.96 inches.

June

Early June brought welcome rain to scattered areas throughout the State, with as much as 7 inches reported around the Augusta area. Tobacco cropping had begun in the more southern counties and fieldwork was active throughout the State. Mid-month brought some additional rainfall, but temperatures soared to over 100 degrees in much of the southeast. By the end of the month, soil moisture was very short to short statewide and crop conditions had deteriorated due to high temperatures and lack of rain. Average temperature for Georgia in June at 80.5 was 3.0 degrees above normal. Rainfall averaged 3.82 inches for the State, .49 inch below normal.

JULY

Soil moisture improved slightly in early July and temperatures were near normal. By mid-month, however, soil moisture levels were rated short to very short and temperatures were 5 to 8 degrees above normal. Harvest of the record setting small grain crops was virtually complete by mid-month, completing an almost ideal harvesting season. Temperatures were in the 100 degree range in late July with numerous reports of "dried-up" creeks, stockwater ponds and irrigation ponds. Corn, soybeans, watermelons, cotton, pastures and hay were all rated in poor to fair condition. Soil moisture supplies statewide reached their lowest level of the 1981 growing season by late July. Heat stress was a major concern for poultry and livestock producers. Temperatures in July, at 81.6 degrees statewide, averaged 2.1 degrees above normal. Rainfall throughout the State averaged only 3.80 inches, 1.81 inches below normal.

AUGUST

Early August rains and cooler temperatures brought relief from drought conditions although the rain was too late for most corn and watermelons. Mid-August saw additional rain in north Georgia and heavy rainfall in the southeast due to tropical storm "Dennis" with over 5 inches falling in Bulloch County. The pattern of showers and thundershowers continued across the State the rest of August with the heaviest amounts in the southern one-third of the State. Tobacco harvest reached 89 percent complete while corn was 67 percent harvested, and peanut combining began with peanuts in fair to good condition at the end of August. Rain was again needed with soil moisture short to adequate in late August with the driest areas in northeast Georgia. Temperatures in Georgia fell 2.2 degrees below normal, averaging 76.9 degrees and rainfall was above average by .41 inch at 4.95 inches.

SEPTEMBER

Crop conditions showed little change the first two weeks of September. Moderate but variable rain fell throughout the State through mid-September with near normal concentrations in northern, and southwestern counties. Temperatures were about normal the first half of September. By late September, dry weather over most of the state was again hurting late maturing crops such as soybeans, cotton, peanuts and hay. Temperatures averaged well below normal the last one-third of the month. Apples were 88 percent picked with supply exceeding the demand. September temperatures remained below normal at 72.3 degrees, 2.0 degrees below normal and rainfall was a scant 1.82 inches, 2.28 inches below normal.

OCTOBER

Light rain fell in early October but soil moisture was still short to very short until October 24th and 25th, when statewide rains of 1 to 2 inches fell. Additional rainfall statewide in late October improved soil moisture supplies to a short to mostly adequate rating. Amounts as high as 2.25 inches were recorded in the mountain regions. Seeding of small grains was well underway while harvesting of corn, apples and peanuts was nearly complete by the end of the month. Peanuts surprised many with a statewide yield of 2,930 pounds per acre. Temperatures averaged a mild 62.2 degrees statewide which were 2.5 degrees below normal. Rainfall in October averaged 3.10 inches, .38 inch above normal.

NOVEMBER

Rainfall during November, was light throughout the State, with the exception of the south central and southeast. Soil moisture supplies were rated as mostly short to adequate at the end of the first week statewide. By the end of the month, soil moisture supplies were very short to short in the northern two-thirds and short to adequate in the southern third of the State. Pecans were 70 percent harvested by the end of November. It was a relatively dry November with rainfall averaging only 1.75 inches, 1.16 inches below normal. Temperatures over the State averaged 54.4 degrees, .1 degree below normal.

DECEMBER

Rain began early in the month and continued most of the month. Soil moisture supplies were replenished rapidly but fieldwork was slowed. Mid-December brought temperatures well below normal and broke low records in numerous areas. By late December, cotton harvest was virtually complete. Livestock were rated in fair to good condition. Heavy precipitation again in late December was accompanied by bitter cold. Temperatures during December in Georgia averaged 43.6 degrees, 3.7 degrees below normal. December was the wettest month in 1981 for Georgia, averaging 6.36 inches of rainfall which was 2.08 inches above normal.

1/ Source: ERS, USDA; FATUS. Fiscal year Oct. - Sept. Export shares by State are estimated from various data bases, primarily from the volume of production by State. New items were included in the commodity groups used for State export shares for 1980 and 1981. Data for 1979/1980 and 1980/1981 are comparable, prior year totals are not necessarily comparable. 2/ Included in soybeans for 1977-1981. 3/ Peanuts only for 1974-1976. 4/ Not shown separately for 1978-1981.

1/ Quarterly estimates discontinued after April 1981. 2/ Includes as "other family" only those household members working 15 hours or more per week without receiving cash wages. 3/ Insufficient data for this category. 4/ Any agricultural worker not included in above categories. 5/ Method of payment by hour may include room and board, housing, meals or food, other items or wages only. 6/ Cash wages only but method of payment may be by hour, day, week, month or piece rate. NA: Not available.

ESTIMATES ISSUED BY GEORGIA CROP REPORTING SERVICE

Current estimates of many data items included in this publication are available from the Georgia Crop Reporting Service at various times throughout the year. The table below indicates the months data are available. Current data may be obtained by calling the Crop Reporting Service or interested persons may be added to one or more of our five mailing lists. The five separate mailing lists are: (1) Weekly Weather and Crops, (2) Weekly Broiler Report, (3) Georgia Agricultural Facts, (4) Georgia Poultry Facts and (5) Georgia Farm Report, a semi-monthly publication containing various crop, livestock, price and other farm data. The annual charge for these publications is: Weekly Weather and Crops, $12; Weekly Broiler Report, $15; Georgia Agricultural Facts, $5; Georgia Poultry Facts, $5, and Georgia Farm Report, $10. Reports are available free of charge to farmers and agri-business firms who provide the basic data on which reports are based. Within availability constraints, a copy of the Georgia Agricultural Facts and Poultry Facts is available to Georgia residents without charge. An order form may be obtained by calling (404-546-2236) or writing the Georgia Crop Reporting Service.
